

**Have you ever thought  
what is common between  
a spoon and thousands of  
things that surround you?**

Co-founders of the project Plasma Craft invite you to participate as an investment partner.

Plasma Craft is a project of the industrial association in the production of devices for electrolytic-plasma surface treatment of metals, engineering and technology integration.

Electrolytic-plasma polishing – is a completely new, ecologically clean technology, which has no analogues in the world. The latest development allows for more than three times to reduce the costs of enterprises, which use chemical and mechanical methods of surface treatment of metals (chemical etching, abrasive polishing).

Plasma Craft project is unique in the field of innovative and strategically-important types of production, such as manufacture of surgical implants, electronics, nuclear power and rocket science. The most relevant application of the technology are aviation, engineering, medicine, manufacture of tools, jewelry, manufacture of interior, tableware and etc.

Based on the discovery of properties of low-temperature plasma the physics-researchers of Scientific Research Institute ‘Sosni’ have been improving the technology of polishing for 20 years. Scientific development team has over 10 patents for the inventions, which formed the basis of Plasma Craft. Installations for electrolytic-plasma polishing, were produced in the experimental production laboratory of research institute, more than 10 years have been successfully used to prepare metal surfaces for coating, deburring and finishing polishing by different companies of Belarus, the Ukraine, Russia and Kazakhstan.

At present, a number of demands from potential customers of CIS countries and abroad about the introduction of technology is increasing. The existing experimental production is unable to meet the prevailing demand to vehicles of electrolytic-plasma polishing, so the co-founders of the project have decided to attract private investments for the organization of mass production in Russia.

It amounts to € 700 000, which will provide for an investment partner the average annual income at least 77%.

If you are interested in the offer, we are ready to demonstrate the presentation and a detailed description of the investment project.
